Professional Profile

Python Backend Developer with 6+ years of commercial experience. Specializes in building reliable, scalable services, complex integrations, and high-load systems — from architecture design to metric configuration and analytics. Prior to development, spent 8+ years as a technical writer, which cultivated skills in working with complex concepts, designing clear systems, and, as a result, using LLMs effectively. Beyond backend work, strong prompt engineering skills enable me to function as a Fullstack Engineer (Senior Backend / Middle Frontend), effectively replacing a React/Vue specialist through familiarity with JavaScript and the use of multi-agent Cursor IDE with a complete toolchain of skills and MCP.

Core Competencies

- **Service Development:** Full-cycle development with Django/DRF, asynchronous frameworks (FastAPI, AIOHTTP, Twisted).
- **Security & Authentication:** Expertise in OAuth2, 2FA, JWT, proxy authorization, Role Based Access Control.
- **Data & Infrastructure:** SQL optimization (recursive CTEs), Apache Kafka (high-load producers/consumers), ETL, containerization (Docker, K8s), monitoring (Prometheus), dashboards (Grafana).
- **Legacy Code:** Refactoring, migration from Python 2 to 3, test coverage.
- **Tools & Approaches:** Pytest, GitLab CI/CD, using AI assistants (Cursor IDE) to accelerate development.

Tech Stack

Category	Technologies
Languages	Python 2/3, JavaScript (ES6+), SQL
Backend Frameworks	Django/DRF, FastAPI, AIOHTTP, Twisted, Pyramid
Databases & ORM	PostgreSQL, Redis, SQLAlchemy, Alembic, peewee ORM
Queues & Async	Apache Kafka, RabbitMQ, Celery
Infrastructure & DevOps	Docker, Kubernetes, Docker Swarm, Git/GitLab, Prometheus, Grafana, Ansible, bash
Testing	Pytest, unittest
Other	REST API, OAuth2, JWT, Linux, HTML/CSS, JavaScript, Vue

Work Experience

Big3

The company develops a universal low-code application platform for business and government, as well as solutions built on it.

Period: August 2024 – December 2025 (1 year 5 months).

Tech Stack: Python 3, Django, DRF, Django Unittest + Pytest, PostgreSQL, Redis, Celery, RabbitMQ, Docker, Docker Swarm, GitLab.

Developed and delivered new functionality for applications built on B3 – the company's proprietary platform. Implemented integrations with third-party services, actively used raw SQL for complex tasks, optimized queries, and debugged code for both applications and the underlying platform.

Key Achievements:

- Optimized complex SQL queries using recursive CTEs, reducing critical operation execution time by 34% (EXPLAIN ANALYZE measurements before/after), thereby lowering database load.
- Refactored legacy code in the B3 core platform, eliminating 12 critical performance bottlenecks.
- Started using Cursor AI assistant in the development process, improving efficiency when writing and debugging code.

During this period I gained hands-on experience with recursive CTEs both in raw SQL and within Django ORM.

Samolet Development

A major real estate developer that extensively uses IT technologies to manage construction and property operations.

Period: April 2023 – August 2024 (1 year 5 months).

Tech Stack: Python 3, Django, FastAPI, PostgreSQL, Redis, RabbitMQ, Celery, Apache Kafka, Docker, Pytest, Prometheus, Grafana, Kubernetes, GitLab.

Key Tasks and Achievements:

- Authentication Systems Development & Security:
 - Designed and implemented two-factor authentication (2FA) for a custom OAuth2 provider, improving security for 15+ corporate applications and protecting data of 8,000+ employees.
 - Implemented social login with mandatory 2FA when linking new accounts.
 - Created a forced logout mechanism: OAuth2 token revocation and session deletion in Redis upon password change or account deactivation.
 - Designed a JWT-based proxy authorization microservice for integration with corporate document management, reducing access approval time by 67% (metrics from the ticket tracker).
- Backend Development & Integrations:
 - Developed high-load Apache Kafka producers and consumers processing 50,000+ events per minute with latency below 12 ms (according to Grafana metrics).
 - Implemented an adapter service for synchronizing data between the equipment inventory system and internal processing, automating handling of 3,200+ equipment units.
 - Introduced RBAC for Apache Kafka, standardizing access management for 23 microservices.
- Infrastructure & Monitoring:
 - Maintained architecture documentation following "architecture as code" principles using [DockHub](#).
 - Developed Grafana dashboards for monitoring Prometheus metrics.
 - Participated in second-line on-call rotations, advising developers from other teams on OAuth2 integration.
- Code Quality:
 - Actively wrote unit and integration tests using Pytest, including refactoring legacy code.

During this period I gained experience with FastAPI, Apache Kafka, Kubernetes, Grafana, and OAuth2 protocol implementation.

Globant

An international IT company specializing in digital transformation and software development for large corporate clients.

Client: Ubisoft, project – an internal tool for visualizing video game defects during manual testing.

Period: November 2021 – November 2022 (1 year).

Tech Stack: Python 2, Python 3, Twisted, PostgreSQL, Redis, Pytest, GitLab.

Key Projects and Achievements:

- Performed a complete migration of a corporate application from Python 2 to Python 3. Refactored 88 modules for compatibility with the new interpreter version while preserving 100% functionality and API backward compatibility. The project gained long-term support, and its security was upgraded to meet modern standards.
- Integrated Microsoft Azure AD as the OAuth2 server, replacing the client's legacy custom authentication token provider.
- Covered critical code sections with integration tests using Pytest, achieving 98% coverage (pytest-cov).

During this period I gained deep practical experience with the Twisted asynchronous framework and mastered integration with cloud authorization providers using Microsoft Azure as an example.

Lendsbay

A fintech startup developing a platform for secure person-to-person lending (P2P lending).

Period: March 2020 – October 2021 (1 year 8 months).

Tech Stack: Python 3, AIOHTTP, Pyramid, PostgreSQL, SQLAlchemy, Alembic, Celery, Redis, RabbitMQ, Docker, GitLab.

Key Tasks and Achievements:

- Developed the backend for the high-load Lendsbay mobile application, handling ~10,000 RPS to the database (source: pg_stat_database), ensuring service stability for tens of thousands of users.
- Business Logic & Integrations:
 - Developed an XML parser for credit bureau extracts, using the data to periodically recalculate the user's proprietary credit score.
 - Implemented functionality for regular notifications to collection agencies about overdue user payments.
 - Designed an automatic penalty waiver algorithm with flexible condition settings, reducing customer churn by 12.3% (according to business analytics).
- Interfaces & Data Visualization:
 - Built an interactive analytics system within the admin panel from scratch: developed dashboards with d3.js charts and complex filtering for analyzing key business metrics.

- On personal initiative, developed a functional prototype of the client-side web interface to evaluate UX hypotheses.

During this period I gained extensive experience with the `AIOWHTTP` asynchronous framework to ensure high performance. I mastered and effectively applied the Pyramid framework for building the admin interface. Actively used `SQLAlchemy` ORM for complex queries and `Alembic` for migrations.

FinTech, CJSC

A Russian vendor and specialized developer of secure government information systems, platforms, and biometric solutions.

Period: March 2017 – December 2017 (10 months).

Tech Stack: Python 2, Django, Django REST Framework (DRF), PostgreSQL, Git.

Developed the backend for the PSZI "Sintez" platform – a system for automated management of administrative and economic units.

Key Tasks and Achievements:

- Participated in developing and maintaining the platform backend using Django and Django REST Framework (DRF).
- Developed REST APIs for frontend integration and communication with related systems.
- Designed and implemented data models, ensuring integrity and efficient PostgreSQL operations.
- Contributed to business logic development related to managing and tracking administrative and economic resources.

Gained experience with Django REST Framework for API development and PostgreSQL in an enterprise project.

Freelance

Period: September 2016 – March 2017 (7 months).

Tech Stack: Python 3, Django, Bootstrap, jQuery, Git.

Key Projects and Experience:

- Internship at Corona Travel: successfully built a forum engine from scratch as a training project using Django, implementing basic posting and commenting functionality. Completed several entry-level practical tasks, reinforcing commercial development and teamwork skills.
- Freelance Projects: developed a rental property management system from scratch using Django, which included managing property listings, calculating payments, and generating reports.

Created a corporate landing page for a financial organization with responsive design in Bootstrap and interactive elements in jQuery.

During this period I gained practical experience building Django backends and implementing user interfaces with Bootstrap and jQuery.

Additional Education

2025

[Advanced Django 5 for Professionals](#)

2024

- [SQL Academy](#)
- [Asynchronous Python](#)

2021

[Interactive SQL Simulator](#)

2020

- [Python Web Developer](#)
- [SQL Course Simulator](#)

2019

- [SQL Basics](#)
- [Building Web Services in Python](#)

2018

[OOP and Design Patterns in Python](#)

2017
